

# HireHub - Day 1 Interview Questions & Answers

## 1. Why did you choose Vite instead of Create React App?

Vite provides a faster development server, faster Hot Module Replacement (HMR), and optimized production builds. It is the modern choice for new React projects.

## 2. Why don't we import all React Icons globally?

We import only the icons we use to keep the bundle size smaller, improve performance, and keep the code maintainable.

## 3. Why do we import Bootstrap in main.jsx?

Bootstrap is a global stylesheet. Importing it once in the entry file makes it available throughout the application.

## 4. Why does style use double curly braces?

The outer `{}` enters JavaScript in JSX, while the inner `{}` creates a JavaScript object that React expects for the style prop.

## 5. Why does the style prop accept an object instead of a CSS string?

React represents styles as JavaScript objects, allowing dynamic values and efficient updates.

## 6. Why separate pages and components?

Pages represent complete screens/routes. Components are reusable UI pieces used inside pages.

## 7. Why wrap App with BrowserRouter?

BrowserRouter provides routing context to all child components so Link, Route, Routes, and other routing features work.

## 8. Why keep Navbar outside Routes?

Navbar is shared across all pages. Rendering it once avoids duplication and follows the DRY principle.

## 9. Why keep mock data in a separate data folder?

It separates data from UI, improves maintainability, and makes replacing mock data with an API easier.

## 10. Why use map() in React?

`map()` transforms an array of data into an array of JSX elements, making it easy to render dynamic lists.
